Final Exam

Monday, April 30, 2018, 2:00PM to 4:30PM

This exam is closed book, but you may use calculators. Make sure your name is on all pages. Show all work, and show it in a logical and organized manner. (Do it carefully, and check it.) Each entire problem is worth 25 points.

1. A tank contains 400 gallons of water and 10 pounds of salt. Water containing a salt concentration of .25 pounds per gallon flows into the tank at a rate of 2 gallons per minute, and the mixture in the tank flows out at the same rate.
   (a) Write down a differential equation relating the quantity Q of salt in the tank at time t and the derivative of Q.
   (b) Solve that differential equation.
   (c) Determine the amount of salt in the tank after a long time.

2. Consider the initial value problem

$$y'' + 12y' + 37y = \sin(t), \quad y(0) = 1,\ y'(0) = 0.$$

   (a) Solve the initial value problem. Be sure to carefully write down all steps in your solution process.
   (b) Write down the steady-state solution.

3. Write down the degree 5 polynomial approximation to the series solution to the following initial value problem.

$$y' + (x+1)y = 0, \quad y(0) = 1.$$

4. Use Laplace transforms to solve the following initial value problem. You may use the table on the back of this sheet.

$$y'' + 3y' + 2y = f(t), \quad y(0) = 1,\ y'(0) = 0, \quad \text{where } f(t) = \left\{ \begin{array}{ll} 0, & 0 \le t < 1 \\ 1, & 1 \le t < 2 \\ 0, & t \ge 2 \end{array} \right\}.$$
